

## Increase Your HVAC System's Efficiency With One Word

There are a variety of ways to keep your

HVAC system running as efficiently as possible and your energy bills low – from turning your thermostat down one degree to increasing the insulation in your home – but nothing is as effective as good, old-fashioned maintenance.

The majority of your HVAC system's maintenance should take two forms: annual checkups and air filter replacements. Having an HVAC technician professionally examine your equipment every year, conduct routine maintenance, and head off issues before they become major headaches can save you hundreds, if not thousands, in the long run.

Your technician can also tell you how often you should be changing your air filter based on how many people are in your household and if you have pets. This is important because changing air filters frequently is just as vital to the health and efficiency of your HVAC system as annual checkups are. Your equipment simply cannot do its job properly if you're forcing it to use a dirty air filter.

Your HVAC system is an investment in home comfort, and maintenance is the best way to get the most out of that investment. Get annual checkups done and change your air filter are the right frequency, and your wallet will thank you.
